DESIGN TWO THOUSAND PTY LTD

TACT TA-4800 RADIO/TELEPHONE INTERCONNECT

INTRODUCTION

TACT, the <u>T</u>elephone <u>A</u>ccess <u>C</u>ontrol <u>T</u>erminal, interconnects a two-way radio system to a telephone line or PABX extension. It allows you to make and receive telephone calls on your two-way radio mobiles and hand-helds. Other features include paging, alarm and telemetry facilities.

Design Two Thousand Pty Ltd, established in 1968, has been making TACT units since 1987, and this TA-4800 is the new flagship model. It is the digital successor to the well-proven TA-7. Here you have the option of dialing telephone numbers using the TA-4800 in the same way as the TA-7.

Things that make the new TA-4800 unique are full remote programmability without the need for a modem, real voice prompts to the user, and the many advantages of digital signal processing.

FEATURES

- Make and receive telephone calls as per the TA-7
- 100 number speed dial
- Last number redial
- Manual patch facility
- Digital recorded voice announcement
- Digital personalised recorded voice announcement
- Called indicator
- Call counter
- Programmable PIN access
- Local and Full Remote programmability
- Two line capability
- DTMF dialing
- Dial tone detect
- Exchange (CO) or PABX line
- Programmable silence disconnect
- Programmable call time limit
- Busy tone detect
- Line reversal detect
- Loop current loss detect
- Data mode
- Programmable call barring
- Call progress display
- Hook flash (100 ms)
- Priority outdial line (L1 default)
- Call waiting on other line tone
- Manual / auto answer for each line
- Programmable ring delay for each line
- Programmable repeater tail timer (COS ignore after PTT release)
- Programmable VOX attack time (Signal detect count)
- Programmable VOX sensitivity (Activate level)

- Programmable VOX persistence (Hang timer)
- Programmable Digital VOX audio delay
- Programmable level adjustments
- Simplex / half duplex/ duplex
- Programmable tail defeat (radio VOX) sensitivity & persistence
- Repeater audio mode (strapable).
- EPROM version number display
- RS232 port for status messages, programming and diagnostics
- RS232 ports for modem & telemetry Interface
- 12 → 48 Vdc working. (Polarity and ground insensitive)
- 1 RU, 19" rack mountable enclosure
- Two Year warranty
- ACA Supplier's Code N468

OPTIONAL

- Alarm input
- Alarm dialer
- Auxiliary output relays
- Paging:

DTMF selcall

Two tone page (Quickcall)

Five / six tone page (Selcall)

Programmable Two tone paging plan letter

Programmable pre-coded paging digits

Programmable Five /six tone paging plan

Programmable paging parameters

- 100 paging and selcall memories
- Emergency number dial mode
- Programmable CTCSS (PL) Encode/Decode

LOCAL AND REMOTE PROGRAMMING

All user programmed data, system options and tone detection parameters can be verified or changed from the inbuilt keypad. Programming is also possible from any telephone or radio on your system using DTMF tones. TACT's digitized voice synthesizer provides confirmation of programming changes and stored data.

Data retained in memory can also be interrogated and altered at higher speed using a PC.

User functions are easily selected by pressing the appropriate number keys. Access to reading or changing system options requires access codes as detailed later in this handbook.

PROGRAMMING PROCEDURES

There are three programming levels that can be accessed:

- 1. Making and receiving telephone calls
- 2. User features
- 3. System configuration

1. From The Keypad

Simply press the required number keys as detailed in this handbook. Confirmation is displayed to the user on the LED monitor.

2. From A Mobile Or Handheld Radio

The mobile radio must have a DTMF pad. Programming from the mobile is identical to that from the keypad. The only difference is that programming information is reported by digitized voice prompts and confirmation messages.

3. From The Local Telephone

Lift handset and programming is identical to that from a mobile.

4. From A Remote Telephone

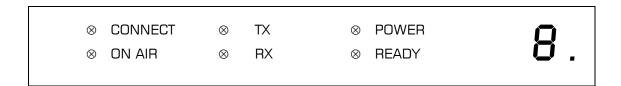

Dial up TACT and wait for answer. You then dial a password and programming is identical to that from a mobile.

TACT INDICATORS

Programming progress and success is displayed on the seven segment LED monitor display. (Remote operation is prompted and confirmed by the voice synthesizer). The 7 segment monitor display also provides call progress information:

- 0 = silence
- 1 =busy tone
- 2 = modulated dial tone
- 3 = Number Unobtainable (N.U.) tone
- 4 = speech
- 5 = continuous tone
- δ = indeterminate tone
- 7 = ringing tone
- 8 = unmodulated ringing tone.
- 9 = random disconnect tone
- n. = DTMF (monitor display shows DTMF digits from radio only!)

In addition to the monitor display, visual indication of operating progress is provided by six LEDs on the front panel marked 'POWER', 'READY', 'CONNECT', 'ON AIR' 'Tx', and 'Rx'.

The 'POWER' LED indicates that power is connected and that the internal fuse is intact. The 'READY' LED indicates that the system is ready for calls. The 'CONNECT' LED illuminates whenever the PSTN telephone line(s) is 'looped'. The 'ON AIR' LED illuminates whenever the audio path is open to the radio. The Tx and Rx LEDs indicate transmit (PTT) and receive (COS) from the radio.

TACT CONNECTORS

12→ 48V power input: BL-2 plug Telephone line: RJ 12 Second telephone line: RJ 12 Radio: RJ 45

RS232 Port RJ 45 (Call Data /Diagnostics)

Please refer to 'CONNECTIONS' for connector details.

MAKING AND RECEIVING TELEPHONE CALLS

Making a Telephone Call

- 1. Press * and listen for "bee-boo".
- 2. Dial the required telephone number. (If you make a mistake, press #, wait for "*Error*" and start dialing again).
- 3. Press *.
- 4. Listen for "TACT dialing"
- 5. Wait for answer, then proceed with conversation.
- 6. To end the call, press ##. Listen for "Line disconnected".

Receiving a Telephone Call

Manual Answer Mode

- 1. When a call comes in, you will hear a ringing sound over the radio "ring...ring...".
- 2. Press * (in between the rings) to answer the call.
- 3. Listen for the "bee-boo" 'Connect' tone.
- 4. Proceed with conversation.
- 5. To end the call, press ##. Listen for "Line disconnected".

Note: The ringing sound will be distinctly different if a call comes in on line two.

Auto Answer Mode

- 1. When a call comes in, you will hear the "bee-boo" 'Connect' tone or "Line connected".
- 2. Proceed with conversation.
- 3. To end the call, press ##. Listen for "Line disconnected".

SPEED DIALING

Abbreviated dialing of up to 100 of your most frequently called telephone numbers.

To Store Speed Dial Numbers

- 1. Press *2.
- 2. Press xx, where xx is the required memory location (00-99).
- 3. Enter the required number.
 - Note that you may enter dialing pauses, * and # as part of the number. *# = dialing pause, ** = * and ## = #
- Press #.
- 5. Listen for "The number is nnnnnnnn".
- 6. NOTE THE NUMBER DOWN IN THE SPEED DIAL INDEX (second last page).
- 7. To check the number in memory, press *2 xx #.

To Dial Speed Dial Numbers

- 1. Press #.
- 2. Enter required memory location (00-99).
- 3. Listen for "TACT dialing".
- 4. Wait for answer, then proceed with conversation.
- 5. To end the call, press ##. Listen for "Line disconnected".

LAST NUMBER REDIAL

- 1. Press # 0 within two seconds of each other.
- 2. Listen for "TACT dialing".
- 3. Wait for answer, then proceed with conversation.
- 4. To end the call, press ##. Listen for "Line disconnected".

OUT-DIAL LINE SELECT (OTHER THAN THE DEFAULT) AND THEN MAKE A CALL (OPTIONAL)

This allows you to make calls from Line 2 of TACT.

- 1. Press # n #, where n is 2 or 1 (line 2 or line 1).
- 2. Press * and listen for "bee-boo".
- 3. Dial the required telephone number.
- Press *.
- 5. Listen for "TACT dialing".
- 6. Wait for answer, then proceed with conversation.
- 7. To end the call, press ##. Listen for "Line disconnected".

Note: You can dial speed dial numbers by dialing # 00-99 instead of steps 2 & 3.

USER FEATURES

RECORDED VOICE ANNOUNCEMENT (OPTIONAL)

TACT can play a digitally $\underline{\mathbf{R}}$ ecorded $\underline{\mathbf{V}}$ oice $\underline{\mathbf{A}}$ nnouncement (RVA) to the telephone caller before the call is directed to the field. The 'RVA' can be a standard announcement or a personally recorded announcement, eg. "You are being connected to a two-way radio". Please note that the personal announcement (PRVA) only works when TACT is programmed for auto answer mode.

Recording Your Personalised Recorded Voice Announcement (PRVA)

The system allows you to record your own announcement of up to 60 seconds.

From a telephone, dial TACT, wait for answer and access remote programming mode with *67PIN#, then:

- Press * 78 # and listen for the "Beep".
 Immediately commence dictating your announcement clearly into the telephone. If you exceed 60 seconds, TACT will replay what has been recorded. If you want to re-record your announcement, repeat step 1.
- 2. When recording is complete immediately press #. Your announcement will be replayed to you.
- 3. To review your announcement you can press * 79 #.
- 4. If you want to disable the personalised RVA, press * 78 # #. Your previous recording is also erased.

RVA Summary

* 78 # = record personalised announcement

= stop recording

* 79 # = review personalised announcement

* 78 # # = Disable and erase PRVA

CALLED INDICATOR

If you leave your vehicle and incoming calls are not answered, TACT will register unanswered calls. You can check this from the radio only.

To Read the Unanswered Call Indicator

1. Press * 30 # and listen for either "*No calls*" or "*n calls*", where n was the number of unanswered calls. The unanswered calls register is then automatically reset.

CALL COUNTER

TACT automatically counts the number of calls connected to the field. You can read the call counter from the radio only.

To Read the Call Counter

1. Press * 31 #. TACT responds "Call count nnnn".

To Reset the Call Counter

1. Press * 31 0 #. TACT responds "Call count 0000".

SYSTEM PERSONAL IDENTIFICATION NUMBER (SYSTEM PIN)

TACT can be programmed to operate only after a valid PIN has been entered. All users on the system are required to insert the PIN before dialing or programming. It can prevent unauthorised use, and allow multiple TACT units to be used on the same radio frequency.

To Program the System PIN

- 1. Press * # p...#, where p... is the required PIN (1 8 digits).
- This number cannot be recalled, it can only be over-written.

HOLD

Placing a Call on Hold

1. Press *1.

To Take the Call off Hold

1. Press *1 (please wait a few seconds for the call to be returned).

TWO LINE OPERATION

To End a Call in Progress and Answer an Incoming Call on the Other Line

- 1. Press ##.
- 2. Press * 1.

To Hold First Call and Answer an Incoming Call on the Other Line

- 1. Press *1.
- 2. Press *.

Alternate between Calls on Hold

1. Press *2.

Conference Call (Not Yet Implemented)

1. Press *3.

To Hang up on the Last Person Spoken to and Return to the Other

- 1 Press ##
- 2. Press *1 (please wait a few seconds for the call to be returned).

FACTORY OPTIONS

ALARM INPUT

Alarm systems such as a security alarm, a door open alarm or mains failure alarm can be connected to the TACT alarm input (Pins 4 & 5 of the 'ALARM' connector). Should the alarm be triggered, TACT can:

- i. Send an "Alarm activated" message to air (see 'System Configuration').
- ii. Dial up to four telephone numbers and send an "Alarm activated" message to line (see below).
- iii. Initiate a Page call.
- iv. Activate auxiliary output relay one to perform an external function.

ALARM DIALER

TACT can perform the function of an alarm dialer. Up to 4 different telephone numbers can be dialed in succession where the "*Alarm activated*" message is played to each number for thirty seconds. When you receive an alarm call, you can press # to acknowledge the alarm and stop TACT from dialing any further for that alarm.

To Enter the First Alarm Dial Number

1. Press * 81 x nnnnnnnnn #, where x is the number of dial attempts and nnnnnnnnn is the number to be dialed.

To Enter the Second Alarm Dial Number

1. Press * 82 x nnnnnnnnn #, where x is the number of dial attempts and nnnnnnnnn is the number to be dialed.

To Enter the Third Alarm Dial Number

1. Press * 83 x nnnnnnnnn #, where x is the number of dial attempts and nnnnnnnnn is the number to be dialed.

To Enter the Fourth Alarm Dial Number

1. Press * 84 x nnnnnnnnn #, where x is the number of dial attempts and nnnnnnnnn is the number to be dialed.

To Erase a Number

1. Enter a single '0' in place of x nnnnnnnnn as detailed just above.

AUXILIARY OUTPUT RELAYS (OPTIONAL)

The Auxiliary Output Relays can be connected to most switchable systems. This provides for the control of sirens, security systems, power gates, electric door strikes and more. The relay(s) can remain latched, automatically reset, or automatically be activated by certain events. See page 17 for connection details.

To Operate the Relay One

1. Press * 07 1 #. Listen for "Relay one operated".

To Interrogate the Relay One State

1. Press * 07 #. Listen for "Relay one operated" or "Relay one idle".

To Reset the Relay One

1. Press * 07 0 #. Listen for "Relay one idle".

To Operate the Relay Two

1. Press * 08 1 #. Listen for "Relay two operated".

To Interrogate the Relay Two State

1. Press * 08 #. Listen for "Relay two operated" or "Relay two idle".

To Reset the Relay Two

1. Press * 08 0 #. Listen for "Relay two idle".

PAGING (OPTIONAL)

Pagers, mobiles and handhelds with paging decoders can be selectively called from any DTMF telephone or from a mobile with a DTMF pad. TACT can encode most two tone (quickcall) and five tone (selcall) paging protocols. Paging plans and parameters are field programmable but best specified at the time of ordering.

TO INITIATE A PAGE CALL

Two Tone Page Call (Quickcall)

1. Press * 72 nn #, where nn is the two tone number.

Five Tone Page or Selective Call (Selcall)

1. Press * 75 nnnnn #, where nnnnn is the five tone number.

PAGING SPEED DIAL

A combination of up to 99 two tone and/or five tone numbers can be stored in memory. This enables abbreviated speed dialing of two tone paging (quickcalls) and five tone paging (selcalls).

To Store Two Tone Page Numbers in Memory

1. Press * 42 nnn # xx, where nnn is the two tone page number and xx (01-99) is the memory location.

To Store Five Tone Page Numbers in Memory

1. Press * 45 nnnnn # xx, where nnnnn is the five tone page number and xx (01-99) is the memory location.

To Speed Dial a Two Tone or Five Tone Paging Call from Memory

1. Press * 4 xx #, where xx is the memory location. Listen for paging tones.

HOOK FLASH

A Hook flash (also called 'Recall' or timed loop break) is used to facilitate PABX and electronic exchange functions such as transfer, hold and recall.

For TACT To Generate a Hook Flash (Timed Loop Break)

1. Press * 6.

LOCAL TELEPHONE (OPTIONAL)

The local telephone is a 'master terminal' that can be used as a monitor, a paging terminal, a central point of contact for field units, a terminal to place calls for mobiles and a terminal to intercept and screen incoming calls to be patched through to the field. In addition, field units can contact the office staff by ringing the local telephone. Telephone calls on the local telephone can either be private or broadcasted.

Calling the Local Telephone from a Mobile

1. Press * 90 #.

Calling a Mobile from the Local Telephone

1. Lift handset and voice call or page mobile.

To Turn On Local Telephone Privacy Mode

1. Press * 91 1 #.

To Turn Off Local Telephone Privacy Mode

1. Press * 91 0 #.

All other programming from the local telephone is identical to that from a mobile or remote telephone.

CALL BARRING (Not yet implemented)

The only easy way of restricting mobile users from dialing outside local or long distance numbers is to limit the number of digits that they are allowed to dial. Please note that emergency numbers are always allowed (000, 111, 911, 112, 999, etc.). For more comprehensive call barring, use the barring facilities of your PABX or your telephone company.

To Set the Number of Digits that can be dialed from a Mobile

From the Keypad of TACT only:

- 1. Press * 59 nn #, where nn can be 00-24.
- 2. To check the number of digits allowed, press * 59 #.

SYSTEM CONFIGURATION

Programming can be done from the TACT inbuilt keypad, remote telephone or radio.

The programming is the same from the keypad, remote phone or the serial port. An extra two steps are required when accessing programming from a phone or radio. After connection, type *67PIN# (where the default PIN = 1234) to enter programming mode. To exit remote programming mode press #*#.

- 1. Press *6703# to enter system configuration programming mode.
- 2. Press *nn, where nn is the required option number from the table below.
 - TACT then reports the selected option number and its current status.
- 3. Enter a new value as required.
 - TACT then reports the option number and its new status.
- 4. Press *# to save and exit, OR

Press # to scroll to the next option OR

Press *nn, where nn is another required option number from the table below.

- 5. Enter a new value as required.
 - TACT then reports the selected option number and its new status.
- 6. Press *# to save and exit (or press ** to abort all changes)

Command Summary

*6703#

* nn where nn is option number

n... = entry

= scroll

* * = abandon

* # = store & end

2		
3	Ring (Lb)	
4	Tip (La)	
5		
6		

ALARM INPUT & AUXILIARY OUTPUT RELAYS (RJ45)

For the connection of an external alarm system. A contact closure fires off the TACT alarm dialler and the Alarm message to air. Two Auxiliary output relays are also provided to trigger external devices. The output relays are controlled from the telephone or radio using DTMF.

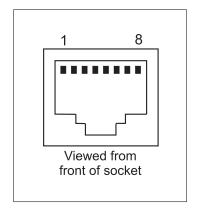

PIN	DESCRIPTION
1	Relay 1 Normally Open
2	Relay 1 Common
3	Relay 1 Normally Closed
4	Alarm In
5	Ground
6	Relay 2 Normally Open
7	Relay 2 Common
8	Relay 2 Normally Closed

PC RS232 (Configured as DCE) (RJ45)

RS232 Serial COM port for a PC. Used at the factory for diagnostic purposes and reserved for future custom applications such as call logging.

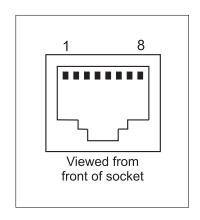

PIN	DESCRIPTION
1	CD (Common to Modem)
2	RI (Common to Modem)
3	RXD (Data received by PC)
4	DTR (Common to Modem)
5	TXD (Data Transmitted by PC)
6	Ground
7	RTS (Common to Modem)
8	CTS (Common to Modem)

MODEM RS232 (Configured as DCE) & ALARM INPUT EXPANDER (RJ45)

RS232 Serial COM port for a modem. Reserved for future custom applications possibly involving a modem controlled by the PC.

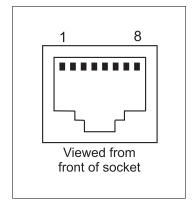

PIN	DESCRIPTION
1	CD (Common to PC)
2	RI (Common to PC)
3	RXD (Data received by Modem)
	OR AI-4775 RXD Alarm Input
	Expansion Module
4	DTR (Common to PC)
5	TXD (Data Transmitted by Modem)
	OR AI-4775 TXD Alarm Input
	Expansion Module
6	Ground
	OR AI-4775 GND Alarm Input
	Expansion Module
7	RTS (Common to PC)
8	CTS (Common to PC)

MIC

This is an auxiliary audio I/O accessory connector. It's most common use is to monitor both-way audio via a set of self-powered PC type speakers.

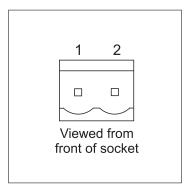

PIN	DESCRIPTION
1	Relay Common contact
2	Relay Normally Open contact
3	
4	
5	
6	Ground
7	Audio out for recording
8	Audio in from a microphone

POWER (BL2)

For power input connection, usually 13.8 Vdc nominal.

PIN	DESCRIPTION
1, 2	$12 \rightarrow 48$ Vdc, isolated,
	polarity insensitive

INTERNAL JUMPER (LINK) SETTINGS

Link	Function			
	Made	Open		
LK15	600 Ohms input impedance for Rx audio from Radio	4k7 Ohms input impedance for Rx audio from Radio		
LK16	Repeater audio (Rx from radio to Tx of radio) looped	Rx from radio to Tx of Radio not looped back		
	back. LK16 provides an audio path from the Rx			
	audio to the Tx audio of the repeater. This provides			
	an audio path on the repeater for normal radio traffic			
	when TACT is idle.			

AUDIO LEVEL ADJUSTMENTS

Please Note: The TA-4800 Tx and Rx audio levels are factory preset to suit most popular radios.

Therefore field adjustment is generally not required, and we recommend that you try

using TACT before attempting the following set up procedures. It is also

recommended that you use parameters *71 and *72 in the System Configuration

menu if tweaking of the Tx and Rx levels is required.

AUDIO OUTPUT TO RADIO (Tx LEVEL) (SETTING THE MODULATION LEVEL)

This procedure is to adjust the Tx audio level from the telephone line to the radio.

The audio output from TACT to the radio is found on Pin 7 of the 'RADIO' connector. It can be connected to the radio's mic input or similar point. The TACT keypad is used to adjust the audio level to radio for correct modulation. If using microphone sensitivity input, a 10:1 resistive voltage divider across the mic input circuit is recommended.

The Tx level setting procedure is as follows:

- 1. Press *97# on the TACT keypad. TACT will respond by transmitting an 820 Hz test tone via the base radio to the mobile for 120 seconds. With an appropriate test set connected to the base radio transmitter output, repeatedly press * to increase or # to decrease the test tone (you can also press a digit 1 → 9 to select an absolute level and then fine tune with the * and # keys) until the test set indicates the correct modulation level. (Refer to the radio manufacturer's documentation and appropriate regulations for relevant specifications. For FM sets the signal should deviate the RF carrier 2.5kHz on systems with 25kHz channel spacing or 1.25kHz on systems with 12.5kHz channel spacing).
 - If a suitable test set is not available, use an ac Volt meter to monitor the input to the radio and repeatedly press * to increase or # to decrease the signal level to match the input specifications of the radio. For example, a radio may require 100 mV at its input. (You can also adjust the level by ear. Listen to the test tone on a receiving mobile, and using the procedure described above, adjust the level until it sounds clear and free of distortion).
- 2. Press 0 to save and exit. TACT reads back a two digit value for Option *71 in the system configuration options.

AUDIO INPUT FROM RADIO (Rx LEVEL)

This procedure is to adjust the Rx audio level from the radio to the telephone line.

Audio output from the radio ($300 \rightarrow 500 \text{ mV}$ p-p recommended) is fed into TACT via Pin 8 of the 'RADIO' connector. As a last resort, the radio speaker output may be used as the audio source. The input impedance of the TACT radio receive audio port is normally 10K Ohms or 600 Ohms nominal with LK15 linked.

To meet ACA specifications, the DTMF audio level from TACT to line should not exceed -6dBm. The radio being used should be adjusted so that -6dBm to line is not exceeded.

The easiest method to calibrate the Rx level to line without expensive or additional equipment is as follows:

- 1. Make sure that the level from radio to TACT is less than 1V RMS.
- 2. Connect the telephone line to Line 1 OR apply a dc loop current (from part number LI-4302 active line driver) to line 1. Place a dB or ac Volt meter across the line.
- 3. Press *98# on the TACT keypad.
- 4. Press and hold 5 on a mobile radio keypad to provide a continuous tone from the radio to the TACT.
- 5. Repeatedly press (on the TACT keypad) * to increase or # to decrease the signal (you can also press a digit 1 → 9 to select an absolute level and then fine tune with the * and # keys) so that the output level is around -6dBm or 0.388 V RMS.
 - You can also observe the TACT display and adjust the level until the display just changes from 6 to 7.
- 6. Press 0 to save and exit. TACT reads back a two digit value for Option *72 in the system configuration options.

PTT AND COS

PRESS TO TALK (PTT) OUTPUT TO RADIO

Description

A relay is provided to apply press to talk (PTT) to the radio when the transmitter is to be keyed. Keying the transmitter also allows TACT to transmit audio from the telephone to the radio field. Normally a radio will require a contact closure to ground to activate its PTT (or key its transmitter).

Connection

'PTT Common' is on Pin 1 of the '*RADIO*' connector and 'PTT Normally Open' is on Pin 2 of the '*RADIO*' connector. The radio's Ground or 0V should be connected to Pin 1 and the radio's PTT input should be connected to Pin 2. If the radio requires a voltage input to activate its PTT then a suitable external voltage should be connected in series with Pin 2.

CARRIER OPERATED SQUELCH (COS) INPUT FROM RADIO

Description and Programming

TACT requires a COS signal from the base radio or repeater when it is receiving a transmission from a mobile. It may take the form of contact closure or a voltage.

TACT must be programmed accordingly:

*6703#	#	Range	Default	
*75	COS Sense	0,1	0	0 = COS active low
				1 = COS active high
*77	COS Threshold	000	000	000 = digital (binary) input OR:
		1-255	128	Voltage reference relative to 5V.
				$(128 = \text{centre of COS swing } 0 \rightarrow 5\text{V})$
*#	•			

Normally, TACT is supplied configured for a contact closure and supplies +5V via 100K to the radio. 'COS Threshold' must then be set to 0 to denote a binary input, and the 'COS Sense' set to 0 if a contact closure to ground denotes a valid COS condition. 'COS Sense' is set to 1 if a valid COS is denoted by an open condition.

Should the radio present a voltage to indicate the COS condition, the 'COS Threshold' must be set to a number in the range 1 to 255 inclusive. 1 represents near 0V and 255 represents +5V. For example, if the radio presents a voltage in the range +0.5V to +3.0V, then the 'COS Threshold' would be set to $\{[(3.0V-0.5V)/2+0.5V]/5V\}$ x 255=89, ie. in the middle of the input voltage range. Note that if either limit is outside the range $0 \rightarrow 5V$, for example -5V to +10V, then while the input is protected against modest voltage excess, only the portion from $0 \rightarrow 5V$ is recognised and in such an instance the 'COS Threshold' would be set to 128, ie. half the sensing range. 'COS Sense' must then be set to 1 if the upper voltage represents valid COS or set to 0 if the lower voltage represents valid COS. Additionally, the voltage source in the radio must be capable of sinking the small current presented by the COS input, ie. about 50 micro Amps. If this is not so, then resistor R104 must be removed from TACT and re-installed into position R106.

Connection

The COS output from the radio is connected to Pin 4 of the '*RADIO*' connector and is sensed relative to ground or 0V with Pin 6 of the '*RADIO*' connector connected to the signal ground (0V) of the radio.

SPECIFICATIONS

Initial Start Up Current

Enclosure 1U high, 19" rack mount, 250mm deep. Finish Dulux metallic charcoal powder coat.

Power Requirement $12 \rightarrow 48$ Vdc nominal, polarity and ground insensitive.

Power Consumption 65 mA @ 48 V

135 mA @ 24 V 300 mA @ 12 V

ie. 3.2 W nominal @ 48V 300 mA for 40 ms @ 48 V 500 mA for 50 ms @ 24 V

750 mA for 90 ms @ 12 V

Operating Temperature Range $-10 \rightarrow +60$ ° C. Storage Temperature Range $-20 \rightarrow 80$ ° C ambient. Humidity, Storage and Operating To 98% non condensing.

Mean Time Between Failure: > 20 years.

TACT Radio Interface IN 10K Ohm input impedance.

Strappable 600 Ohm termination.

OUT 600 Ohm output impedance.

Input level $-30 \rightarrow +6 \text{ dBm adjustable (-13.5 dBm nom.)}$. Output level $-30 \rightarrow +6 \text{ dBm adjustable. (-13.5 dBm nom.)}$.

Frequency range $300 \text{ Hz} \rightarrow 5 \text{ kHz}.$

COS detect High impedance input, floating to +5V, grounded by radio to indicate

COS (inverted sense programmable).

PTT Relay contact, switching to ground for PTT activation.

Telephone Line Interface Standard two wire analogue ring in/loop out.

Ringer Equivalent Number (REN) 0.5

Ring Detect $\geq 10 \text{V RMS } @ 13-55 \text{ Hz } (25 \text{ Hz nominal}), \geq 100 \text{ ms.}$

Answer Delay 100 ms.

In-band Signalling <u>Dual Tone Multi Frequency (DTMF).</u>

DTMF Dialler 100 ms on/off, -10dBm. DTMF Receiver -40 \rightarrow 0 dBm sensitivity.

5 Tone Paging Protocol CCIR 40 ms.

Keypad 12 push button 4 x 3 numeric silicone membrane keypad.

Displays 7 segment numeric readout, 6 x status LEDs.

RS232 Port 9600 baud, N81 format.

Telephone Service Tone detection -30 dBm sensitivity, automatic cadence detection.

ACMA Supplier Code Number N468.

New Zealand Telepermit PTC 210/96/003
Warranty Two years

Firmware Storage Medium EPROM

System Number V4833.32 or later

Speech Number V4901.vv
